Absence of the gene tadast to absence of the hook protein, lack of the flagellar filament and thus loss of mobility. Approximately wild-type levels of the flagellar subunits are still produced and accumulate mostly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Envelope.

MISCELLANBOUS: The N-terminal amino acid sequence was from strain CCUG 951; the DNA sequence was from strain CCUG 17874. Disruption and subcellular localization experiments were performed for both strains. The apparent DI for the hook protein was 5.1.

SIMILARITY: Belongs to the flagella basal body rod proteins
                                                                                                                                                                                                                                                                 O'Toole P.W., Kostrzynska M., Trust T.J.;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M University BAC Center University, College Station, Texas A?M 13-2123, USA using a HindIII Seq primer: M13 For Class: BAC ends.

/clone_lib="WetCor: pSPORTI; Site_1: NotI; Site_2: Sall; This cond. Invariant of the superScript Plasmid System with Gareway Tecnology kit (Invitrogen), following manufacture's protocols. Plasmid DNA was purified using a modified alkaline lysis method. Sequencing reactions were conducted using the kit Big Dye Terminator Cycle Sequencing Ready Reaction (Applied Biosystems) according to the manufacturer's recommendations. Clones were sequenced by the 5' end with T' primer. Sequencing reactions were analyzed on ABI Prism 3100 Genetic Analyzer (Applied Biosystems). The quality and clustering of the ESTS were analyzed using the softwares Phred/Cap3. Only EST sequences with Phred quality greater than 20 and at least 150 bp were considered for clustering."

CDNA library was constructed with the SuperScript Plasmid System with Gateway Tecnology kit (Invitrogen), following manufacture's profocols. Plasmid DNA was purified using a modified alkaline lysis method. Sequencing reactions were conducted using the kit Big Dye Terminator Cycle conducted using the kit Big Dye Terminator Cycle Sequencing Ready Reaction (Applied Biosystems) according to the manufacturer's recommendations. Clones were sequenced by the S. and with IT? primer: Sequencing reactions were analyzed on ABI Prism 3100 Genetic Analyzer (Applied Biosystems). The quality and clustering of the ESTS were analyzed using the softwares Phred/Cap3. Only EST sequences with Phred quality greater than 20 and at least 150 bp were considered for clustering."
